Epitalon 10mg
QUICK GUIDE

The best-known bioregulator, on developer data ♥

WHAT IS EPITALON?

Epitalon is a four-amino-acid peptide from Khavinson's Russian lab, a synthetic version of a pineal-gland extract. It's marketed for anti-aging. The telomerase evidence is test-tube only, and the famous human mortality data come from non-randomized programs run by the developers, mostly with the extract.

Strongest evidence: C · Human observational

RECONSTITUTION

Add 1 mL bacteriostatic water to the 10 mg vial.

This yields 10 mg/mL.

1. Swab both vial tops with an alcohol pad.
2. Draw 1 mL of water and inject it slowly down the vial wall.
3. Roll gently until dissolved; don't shake.
4. Label and refrigerate.

DOSING PROTOCOL

Catalog 'Ukrainian': 10 mg every 4 days × 5 (grade E)

WEEK	DOSE (Short courses, 2–3 times a year)	UNITS (U-100 SYRINGE)
Weeks 1–3	10 mg	100 units

Set 'Every 4 days'. 5 doses end on day 17.

Cycle: catalog: repeat 2–3 times a year.

POTENTIAL BENEFITS

- ♥ **Telomerase:** Activation in human cell cultures only. D · Animal / lab
- ♥ **Mortality claim:** 1.6–1.8× lower in non-randomized programs. C · Human observational
- ♥ **Replication:** No independent human trials. C · Human observational

POTENTIAL SIDE EFFECTS

- Injection-site redness / swelling (catalog)
- No controlled human safety data

The catalog's '28% lower rate' claim from a 12-year follow-up conflicts with other accounts of the same program (6–8 years; 1.6–1.8× lower mortality).

Unit math: every unit value the catalog prints matches across all three mixes.

For subcutaneous injection

Refrigerate after mixing. Catalog: use within 60 days.

Evidence grade C: Human observational
