Kisspeptin 5mg

QUICK GUIDE

The upstream switch for LH ♥

WHAT IS KISSPEPTIN?

Kisspeptin is a natural brain peptide that switches on GnRH neurons, which makes the pituitary release LH and FSH. In IVF trials a single dose triggered egg maturation more safely than hCG. Its repeated use to raise testosterone is untested.

Strongest evidence: B · Human trials

RECONSTITUTION

Add 1.5 mL bacteriostatic water to the 5 mg vial.

This yields 3.3 mg/mL.

1. Swab both vial tops with an alcohol pad.
2. Draw 1.5 mL of water and inject it slowly down the vial wall.
3. Roll gently until dissolved; don't shake.
4. Label and refrigerate.

DOSING PROTOCOL

Catalog: 200 mcg every other day (grade E)

WEEK	DOSE (Every other day)	UNITS (U-100 SYRINGE)
Weeks 1–4	200 mcg	6 units

Set 'Every 2 days'.

Cycle: catalog: 4 weeks on, 4 weeks off.

POTENTIAL BENEFITS

- **IVF trigger:** Egg maturation in 95% (phase 2). B · Human trials
- **Safer trigger:** Designed to avoid hCG-driven ovarian hyperstimulation. B · Human trials
- **Repeated use:** Untested; possible desensitization. E · Community / vendor

POTENTIAL SIDE EFFECTS

- Well tolerated in IVF research
- Possible desensitization with frequent use (catalog)

The catalog says 'every other day' and also '2×/week optimal'.

Unit math: every unit value the catalog prints matches (3.33 mg/mL).

For subcutaneous injection

Refrigerate after mixing. Catalog: use within 60 days.

Evidence grade B: Human trials
