KPV 10mg
QUICK GUIDE

Anti-inflammatory tripeptide, mouse gut data ♥

WHAT IS KPV?

KPV is the last three amino acids of the hormone α-MSH. Given orally to mice, it was absorbed by gut cells and reduced colitis. It hasn't been studied in people, and injection is a different route from the one that worked in mice.

Strongest evidence: D · Animal / lab

RECONSTITUTION

Add 2.5 mL bacteriostatic water to the 10 mg vial.

This yields 4 mg/mL.

1. Swab both vial tops with an alcohol pad.
2. Draw 2.5 mL of water and inject it slowly down the vial wall.
3. Roll gently until dissolved; don't shake.
4. Label and refrigerate.

DOSING PROTOCOL

Catalog: 200 mcg daily (grade E)

WEEK	DOSE (Daily)	UNITS (U-100 SYRINGE)
Weeks 1–8	200 mcg	5 units

Cycle: catalog: 8 weeks on, 4–8 weeks off.

POTENTIAL BENEFITS

- **Colitis (mice):** Oral KPV reduced colitis via PepT1. D · Animal / lab
- **Humans:** No studies. N/E · Not enough evidence
- **Route:** Mouse benefit was oral; injection is untested. D · Animal / lab

POTENTIAL SIDE EFFECTS

- No human data

Vial size isn't stated; 10 mg is implied.

The catalog's own footnote: a '3-unit' step is really 120 mcg, not 100 mcg (100 mcg is 2.5 units).

For subcutaneous injection

Refrigerate after mixing. Catalog: use within 60 days.

Evidence grade D: Animal / lab

For educational use only.
